

B^{24/7} Backup Synology Backup Solution

Our dedicated client backup software for Synology NAS devices allows you to set automated scheduled backup to on-premises storage, our cutting-edge offsite Datacentres, and/or our designated secure cloud storage. All backup jobs can be monitored through a single pane of glass from the web console.

Direct installation on Synology DSM

The client-side advance backup agent (Backup247 Pro) of Backup247 Synology NAS backup solution is directly installed on Synology DSM so that you don't have to mount the NAS as network share for making the data accessible as required by other backup software.

Multi-destination backup

Data in Synology NAS device can be backed up to multiple destinations including on-premises network share, FTP/SFTP server and our designated secure cloud storage sequentially or concurrently to minimize the risk of data loss.

Block level incremental backup

With our In-File Delta speed acceleration technology, only changed blocks within a file are backed up each time. During restoration, these blocks will be combined with previous backups to synthesize a new full backup for quick recovery.

Point in time restore

Our solution allows your Synology NAS user to restore a file from any point in time that it was backed up. The user can even restore multiple versions of a file through a single restore operation if needed.

Retention / Versioning

Our Synology backup solution allows you to set flexible retention policies, including daily, weekly, monthly, yearly policies to suit your organisation and compliance needs.

Unhackable encryption

For backing data up to cloud, data security can be ensured by enabling the 256-bit truly randomized encryption so that the Backup247 Pro backup agent will encrypt the backup data locally on Synology NAS with a 256-bit truly randomized encryption key that is impossible to be hacked even by brute force attack with supercomputer.
